GDB QUICK REFERENCE

Essential Commands

gdb program [core]	debug program [using coredump core]
b [file:]function	set breakpoint at function [in file]
run [arglist]	start your program [with arglist]
bt	backtrace: display program stack
p expr	display the value of an expression
C	continue running your program
n	next line, stepping over function calls
S	next line, stepping into function calls

Starting GDB

gdb
gdb <i>program</i>
gdb program core
gdbhelp

start GDB, with no debugging files begin debugging program debug coredump core produced by program describe command line options

Stopping GDB

quit INTERRUPT exit GDB; also q or EOF (eg C-d) (eg C-c) terminate current command, or send to running process

Getting Help

help help class help command list classes of commands one-line descriptions for commands in class describe command

Executing your Program

run <i>arglist</i>	start your program with arglist
run	start your program with current argument
<pre>run <inf>outf</inf></pre>	start your program with input, output redirected
kill	kill running program
tty <i>dev</i> set args <i>arglist</i> set args show args	use <i>dev</i> as stdin and stdout for next run specify <i>arglist</i> for next run specify empty argument list display argument list
show environment show env var set env var string unset env var	show all environment variables show value of environment variable <i>var</i> set environment variable <i>var</i> remove <i>var</i> from environment

Shell Commands

cd dir	change working directory to dir
pwd	Print working directory
make	call "make"
shell cmd	execute arbitrary shell command string

GDB Version 4

Breakpoints and Watchpoints

÷.

Dicasponito and	vacuponus
break [file:]line b [file:]line	set breakpoint at <i>line</i> number [in <i>file</i>]
	eg: break main.c:37
break [file:]function	
break + <i>offset</i> break - <i>offset</i>	set break at offset lines from current stop
break * <i>addr</i>	set breakpoint at address addr
break	set breakpoint at next instruction
break if <i>expr</i>	break conditionally on nonzero expr
cond n [expr]	new conditional expression on breakpoint <i>n</i> ; make unconditional if no <i>expr</i>
tbreak	temporary break; disable when reached
rbreak <i>regex</i>	break on all functions matching regex
watch expr	set a watchpoint for expression expr
catch x	break at C++ handler for exception x
info break	show defined breakpoints
info watch	show defined watchpoints
clear	delete breakpoints at next instruction
clear [file:]fun	delete breakpoints at entry to <i>fun(</i>)
clear [file:]line	delete breakpoints on source line
delete $[n]$	delete breakpoints for breakpoint n]
derece [n]	delete breakpoints [of breakpoint n]
disable $[n]$	disable breakpoints [or breakpoint n]
enable $[n]$	enable breakpoints [or breakpoint n]
enable once $[n]$	enable breakpoints [or breakpoint n]; disable
	again when reached
enable del $[n]$	enable breakpoints [or breakpoint n]; delete when reached
ignore n count	ignore breakpoint n, count times
commands <i>n</i> [silent] <i>command-list</i>	execute GDB <i>command-list</i> every time breakpoint <i>n</i> is reached. [silent suppresses default display]
end	end of command-list
Program Stack	

backtrace [n]	print trace of all frames in stack; or of n
bt [<i>n</i>]	frames—innermost if $n>0$, outermost if
с Г I	<i>n</i> <0
frame [n]	select frame number <i>n</i> or frame at address <i>n</i> ; if no <i>n</i> , display current frame
	• •
up n	select frame <i>n</i> frames up
down n	select frame n frames down
info frame [addr]	describe selected frame, or frame at addr
info args	arguments of selected frame
info locals	local variables of selected frame
info reg [<i>rn</i>]	register values [for reg rn] in selected
info all-reg [<i>rn</i>]	frame; all-reg includes floating point
info catch	exception handlers active in selected frame

Execution Control

Execution Contro	
<pre>continue [count] c [count]</pre>	continue running; if <i>count</i> specified, ignore this breakpoint next <i>count</i> times
step [count] s [count]	execute until another line reached; repeat <i>count</i> times if specified
stepi [count] si [count]	step by machine instructions rather than source lines
next [count] n [count]	execute next line, including any function calls
nexti [<i>count</i>] ni [<i>count</i>]	next machine instruction rather than source line
until [<i>location</i>] finish return [<i>expr</i>]	run until next instruction (or <i>location</i>) run until selected stack frame returns pop selected stack frame without executing [setting return value]
signal <i>num</i> jump <i>line</i> jump * <i>address</i> set var= <i>expr</i>	resume execution with signal <i>s</i> (none if 0) resume execution at specified <i>line</i> number or <i>address</i> evaluate <i>expr</i> without displaying it; use for
See var-expr	altering program variables
Display	
<pre>print [/f] [expr] p [/f] [expr]</pre>	show value of <i>expr</i> [or last value \$] according to format <i>f</i> :
x	hexadecimal
d	signed decimal
u	unsigned decimal
0	octal
t	binary
a c	address, absolute and relative character
f	floating point
call $[/f]$ expr	like print but does not display void
x [/Nuf] expr	examine memory at address <i>expr</i> ; optional format spec follows slash
Ν	count of how many units to display
и	unit size; one of
	b individual bytes
	h halfwords (two bytes)
	w words (four bytes)
	g giant words (eight bytes)
f	printing format. Any print format, or
	s null-terminated string
disassem [addr]	i machine instructions display memory as machine instructions

Automatic Display

display $[/f] expr$	show value of <i>expr</i> each time program stops [according to format f]
display	display all enabled expressions on list
undisplay n	remove number(s) <i>n</i> from list of automatically displayed expressions
disable disp n	disable display for expression(s) number n
enable disp n	enable display for expression(s) number n
info display	numbered list of display expressions

[] surround optional arguments

... show one or more arguments

Expressions

expr	an expression in C, C++, or Modula-2 (including function calls), or:
addr@len	an array of len elements beginning at addr
file::nm	a variable or function nm defined in file
{type}addr	read memory at addr as specified type
\$	most recent displayed value
\$ <i>n</i>	nth displayed value
\$\$	displayed value previous to \$
\$\$n	<i>n</i> th displayed value back from \$
\$_	last address examined with x
\$	value at address \$_
\$var	convenience variable; assign any value
	-h

show values [n] show last 10 values [or surrounding n] show convenience display all convenience variables

Symbol Table

info address s	show where symbol s is stored
<pre>info func [regex]</pre>	show names, types of defined functions (all, or matching <i>regex</i>)
info var [regex]	show names, types of global variables (all, or matching <i>regex</i>)
whatis [<i>expr</i>] ptype [<i>expr</i>] ptype <i>type</i>	show data type of <i>expr</i> [or \$] without evaluating; ptype gives more detail describe type, struct, union, or enum

GDB Scripts source script

define cmd

document cmd

help-text

command-list

create new GDB command <i>cmd</i> ; execute script defined by <i>command-list</i> end of <i>command-list</i> create online documentation for new GDB command <i>cmd</i>	read, scr	execute GDB commands from file
create online documentation for new GDB command <i>cmd</i>		· · · · · · · · · · · · · · · · · · ·
end of <i>help-text</i>	creat cor	e online documentation for new GDB nmand <i>cmd</i>

Signals

end

end

handle signal ast	specify CDP ections for signal
handle <i>signal act</i>	specify GDB actions for signal:
print	announce signal
noprint	be silent for signal
stop	halt execution on signal
nostop	do not halt execution
pass	allow your program to handle signal
nopass	do not allow your program to see signal
info signals	show table of signals, GDB action for each

Debugging Targets

target type param
help target
attach <i>param</i>
detach

connect to target machine, process, o	r file
display available targets	
connect to another process	
release target from GDB control	

Controlling GDB

set param value set one of GDB's internal parameters show param display current setting of parameter Parameters understood by set and show: complaints *limit* number of messages on unusual symbols enable or disable cautionary queries confirm on/off editing on/off control readline command-line editing height *lpp* number of lines before pause in display Language for GDB expressions (auto, c or language *lang* modula-2) listsize n number of lines shown by list use str as GDB prompt prompt str radix base octal, decimal, or hex number representation control messages when loading symbols verbose on/off number of characters before line folded width cpl write on/off Allow or forbid patching binary, core files (when reopened with exec or core) history ... groups with the following options: h ... h exp off/on disable/enable readline history expansion h file *filename* file for recording GDB command history h size size number of commands kept in history list h save off/on control use of external file for command history print ... groups with the following options: р... p address *on/off* print memory addresses in stacks, values p array off/on compact or attractive format for arrays p demangl *on/off* source (demangled) or internal form for C++ symbols demangle C++ symbols in machinep asm-dem *on/off* instruction output p elements *limit* number of array elements to display p object on/off print C++ derived types for objects p pretty off/on struct display: compact or indented p union on/off display of union members p vtbl *off/on* display of C++ virtual function tables show last 10 commands show commands show commands nshow 10 commands around number nshow next 10 commands show commands +

Working Files

file [file]	use <i>file</i> for both symbols and executable; with no arg, discard both
core [file]	read <i>file</i> as coredump; or discard
exec [file]	use <i>file</i> as executable only; or discard
symbol [file]	use symbol table from <i>file</i> ; or discard
load <i>file</i>	dynamically link <i>file</i> and add its symbols
add-sym <i>file addr</i>	read additional symbols from <i>file</i> , dynamically loaded at <i>addr</i>
info files	display working files and targets in use
path dirs	add <i>dirs</i> to front of path searched for executable and symbol files
show path	display executable and symbol file path
info share	list names of shared libraries currently loaded

Source Files

Source Flies	
dir names	add directory names to front of source path
dir	clear source path
show dir	show current source path
list	show next ten lines of source
list -	show previous ten lines
list lines	display source centered around <i>lines</i> , specified as one of:
[file:]num	line number [in named file]
[file:]function	beginning of function [in named file]
+off	off lines after last printed
-off	off lines previous to last printed
*address	line containing address
list f, l	from line f to line l
info line <i>num</i>	show starting, ending addresses of compiled code for source line <i>num</i>
info source	show name of current source file
info sources	list all source files in use
forw <i>regex</i>	search following source lines for regex
rev regex	search preceding source lines for regex

GDB under GNU Emacs

M-x gdb	run GDB under Emacs
C-h m	describe GDB mode
M-s	step one line (step)
M-n	next line (next)
M-i	step one instruction (stepi)
C-c C-f	finish current stack frame (finish)
M-c	continue (cont)
M-u	up arg frames (up)
M-d	down arg frames (down)
C-x &	copy number from point, insert at end
C-x SPC	(in source file) set break at point
